

An innovation platform for young engineering students

## Basic Details

- ❑ **Team Name :** Team SpeedSage
- ❑ **Project Name :** Car Cognition AI
- ❑ **Team Leader Name :** Animesh Patra
- ❑ **Institute Name :** Institute of Technical Education & Research (ITER) , SOA University , Bhubaneswar
- ❑ **Theme Name :** Automotive Verticals
- ❑ **Topic Name :** Generative AI for Delivering Great Product Experience

# Car Cognition AI

- ❑ **Project Topic :** Generative AI for Delivering Great Product Experience
- ❑ **Project Subtopic :** Generative AI solutions for customer engagement during pre-sales – Enhances customer interactions during the pre-sales phase with AI applications.
- ❑ **Project Theme :** Automotive verticals
- ❑ **Project Idea :** An **interactive website** where an **AI powered virtual assistant** provides personalized tours of different automotive products. Customers can ask questions, receive tailored recommendations, and even see **AI-generated simulations** of products in various use-case scenarios.
- ❑ **Virtual Assistant :** AutoSensei

CAR COGNITION AI  
*Drive smarter with Ai insight*

# Introduction

Discover a revolutionary way to explore automotive products with our interactive website, featuring an AI-powered virtual assistant that offers personalized tours, tailored recommendations, and immersive AI-generated simulations. Enhance your car-shopping experience by asking questions and seeing vehicles in real-world scenarios like never before.

## Team

- ❑ Team Member 1 : Animesh Patra [B.Tech(CSE)] (III Year)
- ❑ Team Member 2 : Aiswarya Patra [B.Tech(CSE)] (III Year)
- ❑ Team Member 3 : Debadarshi Omkar [B.Tech(CSE)] (III Year)
- ❑ Team Member 4 : G.Praveen Kumar Rao [B.Tech(CSE)] (III Year)
- ❑ Team Member 5 : Satyajit Jenamani [B.Tech(CSE)] (III Year)
- ❑ Faculty Advisor : Aditi Panda

# Meet our team

**Animesh Patra**

**G.Praveen Kumar Rao**

**Aiswarya Patra**

**Satyajit Jenamani**

**Debadarshi Omkar**

# Problem Statement

## Problem or Challenge

- ❑ **Complex Decision-Making:** Customers struggle to understand and compare advanced features of modern automotive products.
- ❑ **Limited Personalized Assistance:** Traditional online resources lack personalized, interactive engagement for potential buyers.
- ❑ **Inadequate Visual Simulations:** Current platforms fail to provide immersive, AI-generated simulations of automotive products in real-world scenarios.

## Market Size

- ❑ **Global Automotive Market:** Estimated at **\$3.5 trillion in 2023** with a projected **CAGR of 6.77% from 2023 to 2033**. (Source: <https://www.sphericalinsights.com/> )
- ❑ **Digital Transformation in Automotive Sales:** Increasing demand for online car shopping experiences, with a growing focus on virtual showrooms and AI-driven customer support
- ❑ **AI in Customer Experience:** AI-powered virtual assistants market expected to reach **\$11.2 billion by 2026**, driven by advancements in NLP and machine learning. (Source: [www.marketsandmarkets.com](http://www.marketsandmarkets.com) )
- ❑ **Competitive Edge:** Companies leveraging AI for personalized customer engagement and immersive simulations are poised to capture a significant market share, enhancing customer satisfaction and sales conversion rates.

## Future Potential

- ❑ **Scalable Platform:** Expansion into other sectors like real estate, retail, and electronics, providing personalized **virtual tours and simulations**.
- ❑ **Integration with Emerging Technologies:** Incorporation of **AR/VR** for enhanced immersive experiences, further revolutionizing online shopping and product exploration.

# Objective & Approach

## Objectives

- ❑ Provide an innovative, interactive platform for automotive product exploration through an **AI-powered virtual assistant**.

## Approaches

- ❑ **User-Centric Design:** Develop a **user-friendly interface** to ensure seamless interaction and engagement.
- ❑ **Conversational AI:** **Implement advanced NLP models** to enable natural, context-aware conversations with users.
- ❑ **Personalized Recommendations:** Utilize machine learning algorithms to analyze user preferences and provide tailored product suggestions.
- ❑ **Immersive Simulations:** Create AI-generated simulations to showcase vehicles in various real-world scenarios.
- ❑ **Integration of APIs:** Leverage **automotive APIs** for real-time data on product specifications and features.
- ❑ **Continuous Improvement:** Employ user feedback and analytics to iteratively enhance the **virtual assistant's capabilities** and user experience.
- ❑ **Scalable Architecture:** Design a **robust backend** to support future expansions and integrations with emerging technologies like **AR/VR**.

# Solution Overview

## Key Components and Functionalities

- ❑ **Interactive Website Interface**
  - ❑ User-Friendly Design: **Intuitive navigation** and visually appealing layout for seamless user experience.
  - ❑ Responsive Design: Optimized for desktop and mobile devices to ensure accessibility across all platforms.
- ❑ **AI-Powered Virtual Assistant**
  - ❑ Natural Language Processing (NLP): Advanced NLP models enable natural, context-aware conversations with users.
  - ❑ Conversational Interface: Allows customers to ask questions and receive **instant responses** about automotive products.
  - ❑ Multilingual Support: Provides assistance in multiple languages to cater to a **global audience**.
- ❑ **Personalized Recommendations**
  - ❑ User Profiling: Analyzes user preferences and **interaction history** to generate personalized car recommendations.
  - ❑ Machine Learning Algorithms: Continuously improve recommendation accuracy based on user **feedback and behavior**.
- ❑ **AI-Generated Simulations**
  - ❑ Real-World Scenarios: Visualize vehicles in various use-case scenarios such as different driving conditions and environments.
  - ❑ High-Quality Visuals: Utilize advanced **AI techniques** and **computer vision** to create realistic and **engaging simulations**.
- ❑ **Comprehensive Data Integration**
  - ❑ Automotive APIs: Integrate data from multiple automotive databases to provide detailed and up-to-date information on car models, features, and specifications.
  - ❑ Real-Time Updates: Ensure that the **latest data** is always available to users.
- ❑ **Scalability and Performance**
  - ❑ Cloud-Based Infrastructure: Deployed on scalable cloud platforms to handle high traffic and ensure reliability.
  - ❑ Modular Architecture: Designed to easily incorporate **future enhancements and integrations with emerging technologies**.

# Solution Overview

## Solution Novelty:

### ❑ Innovative AI Integration

- ❑ Combines cutting-edge NLP and machine learning technologies to create a highly interactive and personalized user experience.
- ❑ Utilizes AI-generated simulations to offer an unprecedented level of detail .

### ❑ Enhanced Personalization

- ❑ Leverages user data to deliver highly tailored recommendations, setting it apart from traditional car-buying platforms.
- ❑ Continuously adapts to user preferences, providing a dynamic and engaging experience.

### ❑ Immersive Visual Experience

- ❑ Offers realistic simulations, allowing users to explore vehicles in various scenarios and environments.
- ❑ Bridges the gap between online research and in-person showroom visits, making car shopping more convenient and informative.

### ❑ Global Accessibility

- ❑ Multilingual support ensures that users from different regions can access and benefit from the platform.
- ❑ Responsive design guarantees a consistent experience across all devices.

### ❑ Future-Proof Design

- ❑ Scalable and modular architecture allows for easy integration of future technologies like AR/VR, enhancing the platform's capabilities and staying ahead of market trends.
- ❑ This detailed overview highlights the comprehensive and innovative approach of the interactive website with an AI-powered virtual assistant, emphasizing its key components, functionalities, and the unique value it brings to the automotive market.

# Challenges Faced

## ❑ Challenges

- ❑ **Complexity of NLP:** Ensuring accurate understanding of user queries and **natural conversation flow**.
- ❑ **Data Integration:** Aggregating and normalizing data from various automotive APIs.
- ❑ **Personalization Accuracy:** Providing highly relevant recommendations based on diverse user preferences.
- ❑ **Realistic Simulations:** Generating **convincing AI-driven simulations** of automotive products in different use-case scenarios.
- ❑ **Scalability:** Designing a system capable of handling **high traffic** and **future expansions**.
- ❑ **User Experience:** Creating an intuitive and engaging interface that users find easy to navigate.

## ❑ Solutions

- ❑ **Advanced NLP Models:** Leveraged pre-trained models from **Hugging Face Transformers** and fine-tuned them for our specific domain.
- ❑ **Robust Data Pipeline:** Built a comprehensive **ETL (Extract, Transform, Load)** process to seamlessly integrate and standardize data from multiple sources.
- ❑ **Machine Learning Algorithms:** Implemented sophisticated recommendation algorithms and continuously refined them with user feedback and interaction data.
- ❑ **AI & Computer Vision:** Used **state-of-the-art AI techniques** and **OpenCV** to develop realistic simulations, ensuring high visual fidelity.
- ❑ **Cloud Infrastructure:** Deployed on scalable cloud platforms like **AWS**, enabling dynamic scaling to meet varying demand.
- ❑ **User Testing & Feedback:** Conducted extensive usability testing and iteratively improved the **UI/UX** based on user feedback and behavior analytics.

# Technological Implementation

Creating an interactive virtual showroom with an AI assistant requires a combination of technologies across various areas such as web development, AI, and interactive simulations. Here are the frameworks, languages, and libraries you might need:

## ❑ Frontend Development

- ❑ **HTML/CSS (Tailwind)**: For structuring and styling the website.
- ❑ **JavaScript**: For adding interactivity to the website.
  - ❑ **React.js**: A popular JavaScript library for building user interfaces.

## ❑ Backend Development

- ❑ **Node.js**: A JavaScript runtime for building scalable server-side applications.
  - ❑ **Express.js**: A web application framework for **Node.js**.

## ❑ AI and Machine Learning

- ❑ **Python Libraries**:
  - ❑ **Pyaudio**: Frameworks for building and training machine learning models.
  - ❑ **Pytsx3**: Convert text to speech.
  - ❑ **Tkinter**: React to user input, changes from your program and even refreshes the display only when actively running an event loop.
  - ❑ For natural language processing (**NLP**) tasks.
  - ❑ **PIL/PILLOW** - Python image library (deals with images).
- ❑ **Pre-trained Models**:
  - ❑ **Hugging Face Transformers**: For leveraging pre-trained **NLP models** for the AI assistant.

# Technological Implementation

## ❑ Databases

- ❑ **MongoDB**: A NoSQL database for storing user interactions and product data.

## ❑ Cloud Services

- ❑ **AWS**: For hosting, scalable storage, and machine learning services.
- ❑ **AWS Lambda**: For running backend functions.

## ❑ APIs and Integrations

- ❑ **RESTful APIs**: For communication between frontend and backend.
- ❑ **GraphQL**: An alternative to **REST** for more efficient data fetching.

## ❑ DevOps and Deployment

- ❑ **Docker**: For containerizing applications.
- ❑ **Kubernetes**: For orchestrating containerized applications.
- ❑ **CI/CD Tools**: Such as **Git** and **GitHub Actions** for automated testing and deployment.

## ❑ Putting It All Together

- ❑ Frontend: **React.js** for UI, communicating with the backend via **REST** or **GraphQL**.
- ❑ Backend: **Node.js/Express.js** for handling requests, processing data, and serving the AI models.
- ❑ AI: Python with **Pyaudio** for building the AI models, using **NLP** libraries for understanding customer queries.

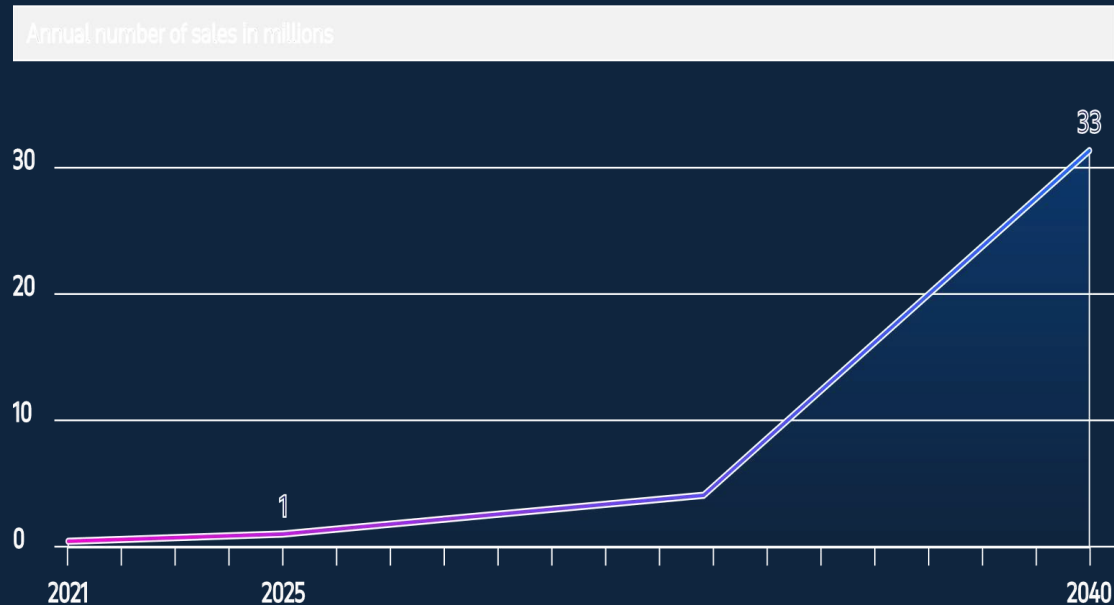

# Technological Implementation

# Results & Achievements

## Predictions on AI in automotive adoption

## Global autonomous vehicle sales

Data source: deloitte.com—Autonomous Driving. Moonshot Project with Quantum Leap from Hardware to Software & AI Focus

## Global automotive AI market forecast

Data source: deloitte.com—Autonomous Driving. Moonshot Project with Quantum Leap from Hardware to Software & AI Focus, 2019

# Results & Achievements

## □ Outcomes

- The global AI automotive market size is expected growth of **CAGR 48% from 2017 to 2025**.
- **By 2025** , the market size of AI in the automotive industry forecast up to **reach \$27 billion**.
- AI is expected to save the automotive industry **\$160 billion** in costs **by 2025**.

## □ Achievements

- AI technology is expected to lead to **22.3%** increase in automotive industry **revenues by 2030**.
- Global autonomous vehicle annual sale would increase to **33 million till 2040**.
- AI-powered automotive software could save **\$1.3 trillion** in accident-related costs **by 2027**.

## □ Impacts

- AI-powered automotive software could **save \$1.3 trillion** in accident-related costs **by 2027**.
- AI-driven predictive maintenance in cars can reduce maintenance costs **by 40%**.

# Demonstration

## Proof of Concept:

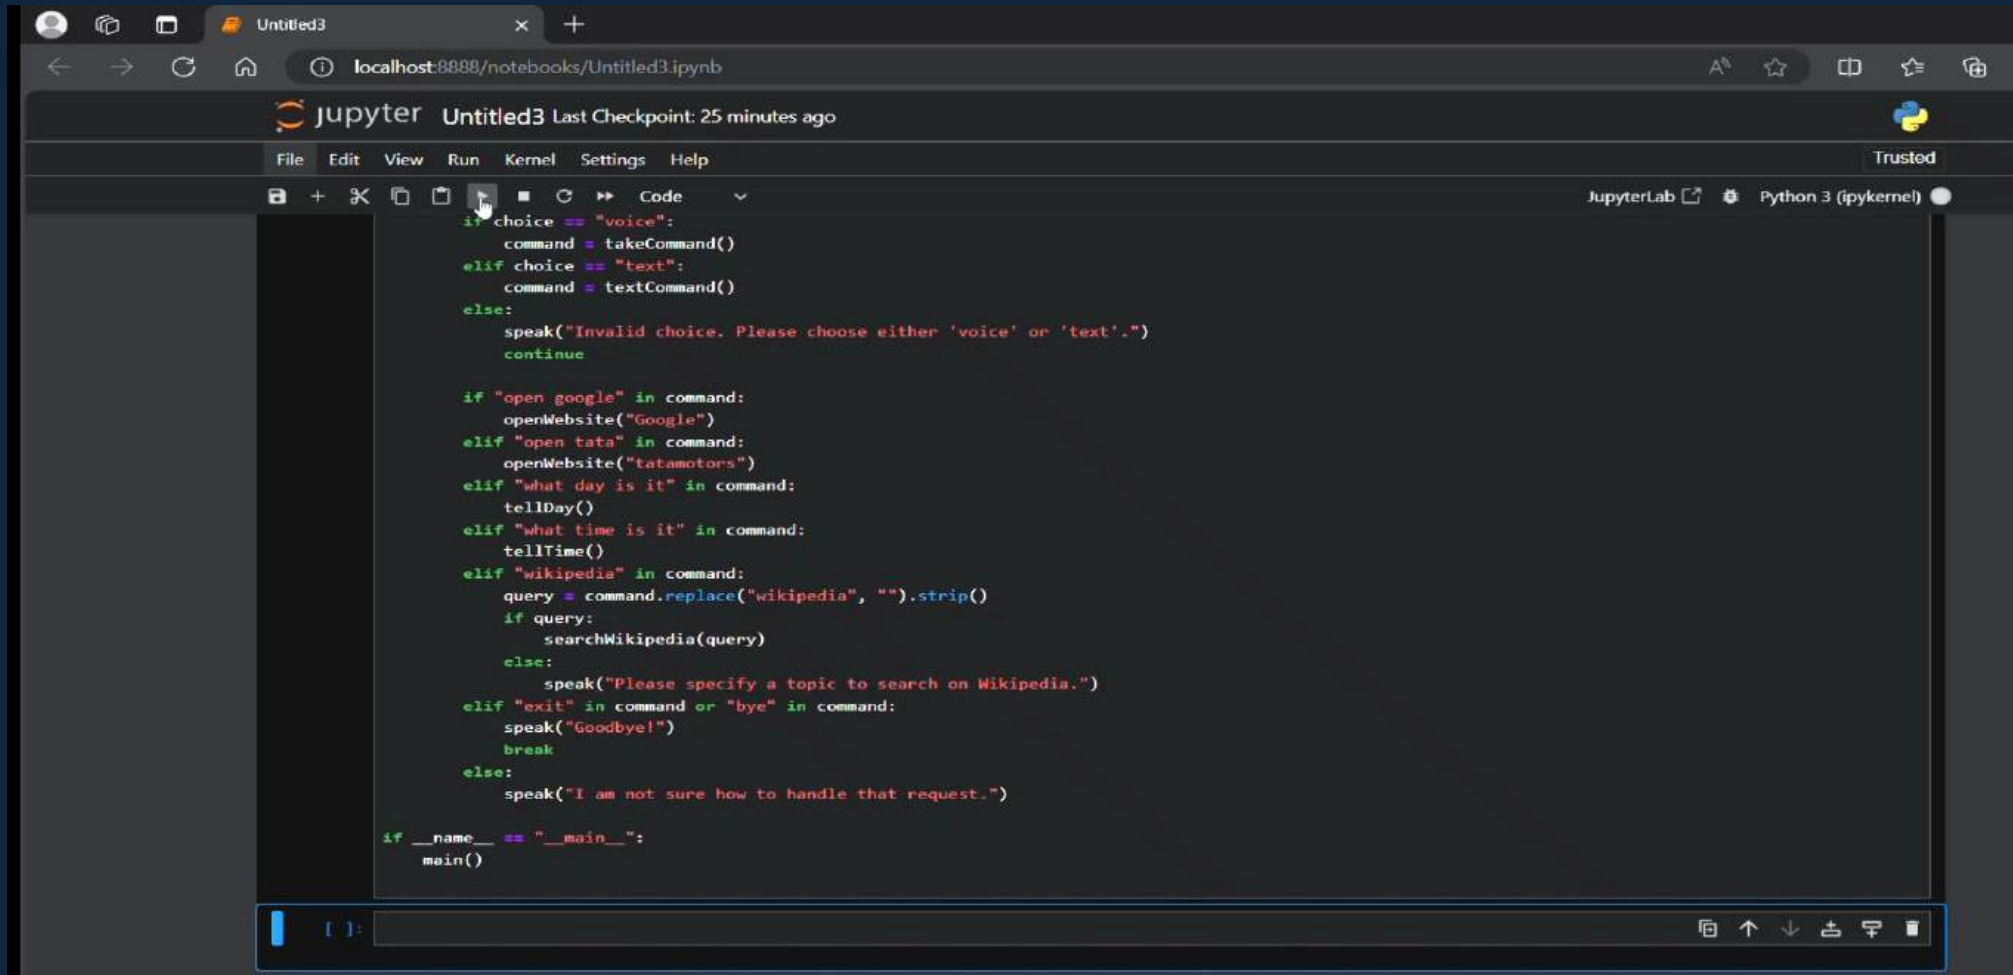

# Demonstration

Website:

# Demonstration

## Virtual Assistant:

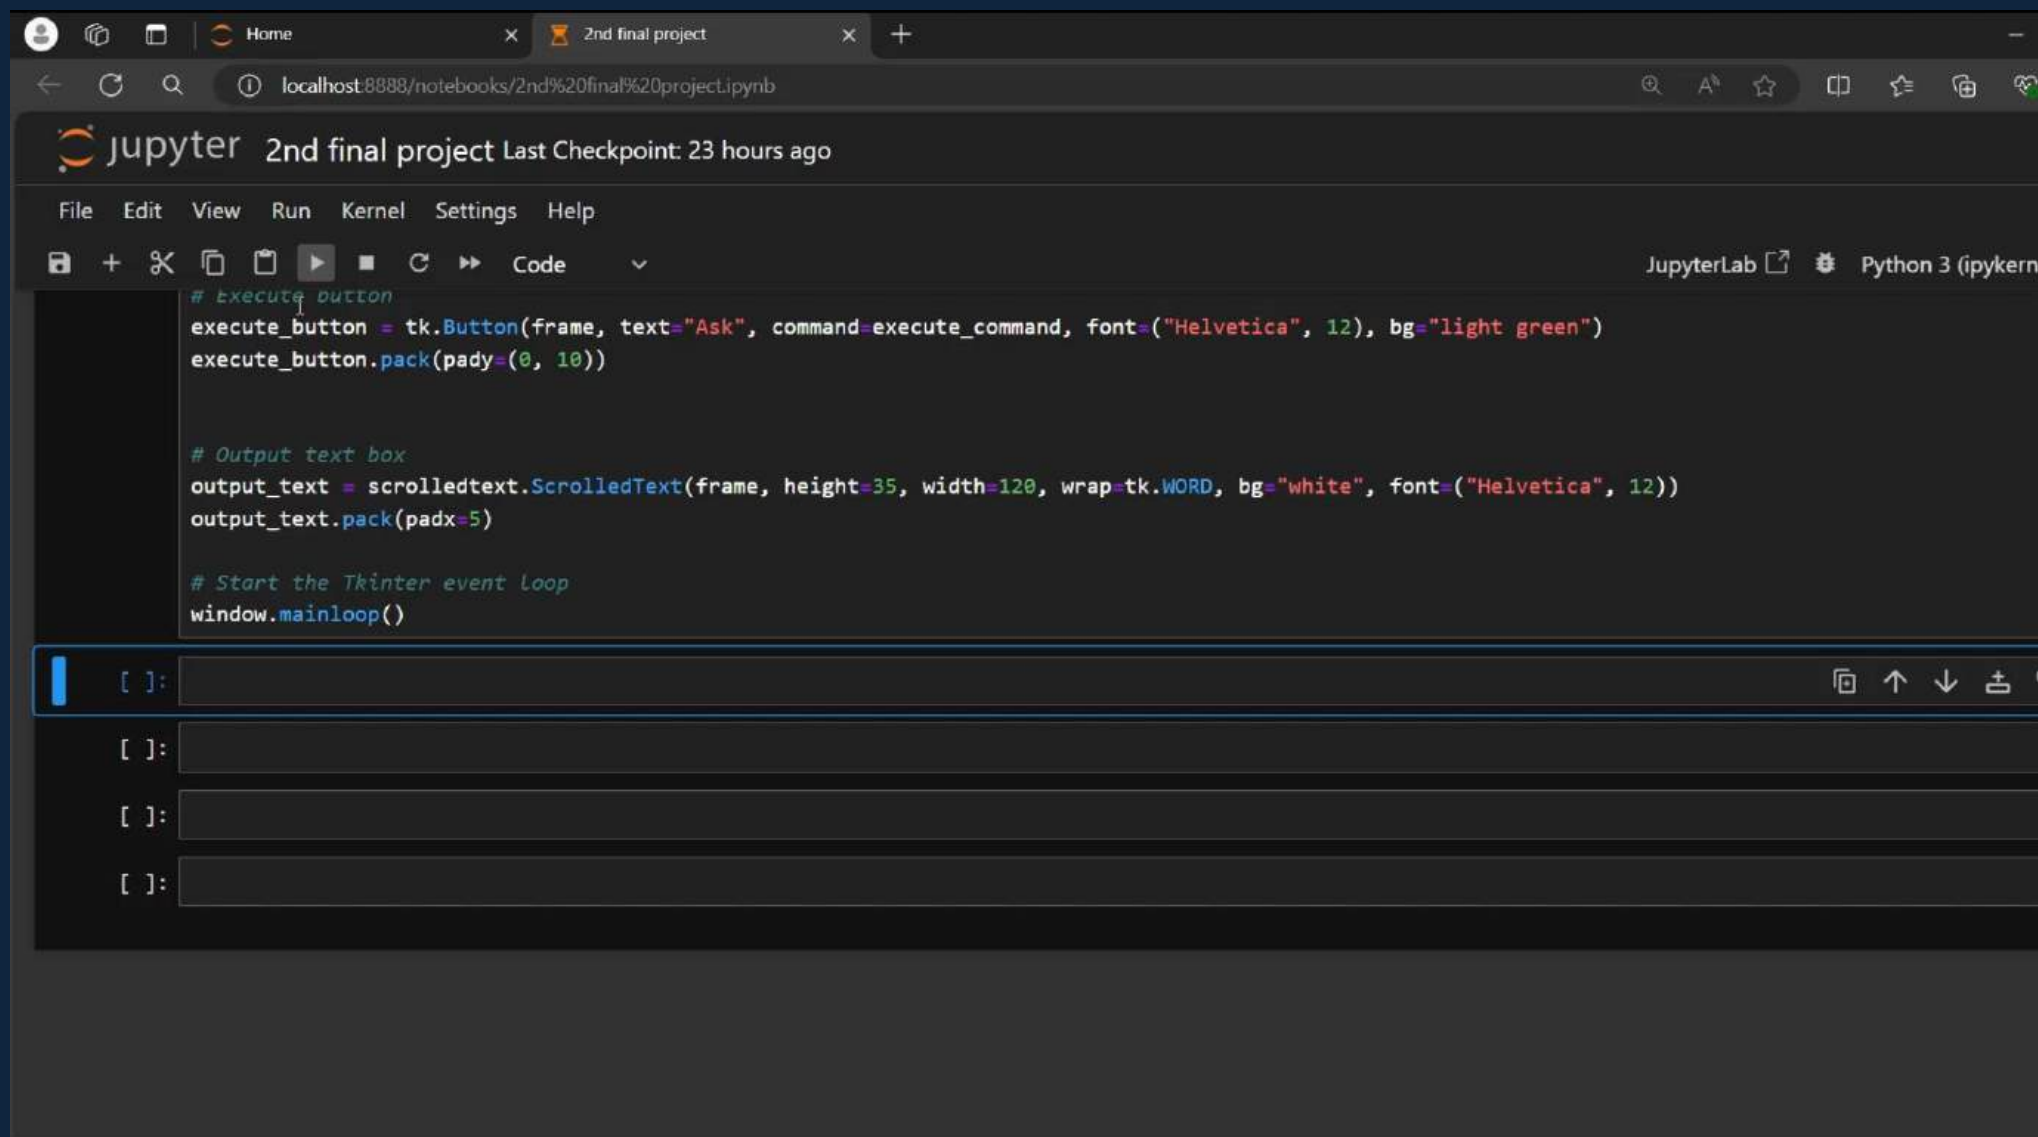

The screenshot displays a JupyterLab environment with a single notebook titled 'Untitled3'. The browser address bar shows 'localhost:8888/notebooks/Untitled3.ipynb'. The JupyterLab interface includes a menu bar (File, Edit, View, Run, Kernel, Settings, Help) and a toolbar with icons for file operations and execution. The code editor contains a Python script for a virtual assistant. The script uses a loop to listen for user input and performs various actions based on the input, such as opening websites, telling the day or time, searching Wikipedia, and saying goodbye. The script is enclosed in a main function that is called when the script is executed.

```
if choice == "voice":
    command = takeCommand()
elif choice == "text":
    command = textCommand()
else:
    speak("Invalid choice. Please choose either 'voice' or 'text'.")
    continue

if "open google" in command:
    openWebsite("Google")
elif "open tata" in command:
    openWebsite("tatamotors")
elif "what day is it" in command:
    tellDay()
elif "what time is it" in command:
    tellTime()
elif "wikipedia" in command:
    query = command.replace("wikipedia", "").strip()
    if query:
        searchWikipedia(query)
    else:
        speak("Please specify a topic to search on Wikipedia.")
elif "exit" in command or "bye" in command:
    speak("Goodbye!")
    break
else:
    speak("I am not sure how to handle that request.")

if __name__ == "__main__":
    main()
```

# Demonstration

The screenshot displays a JupyterLab web interface in a browser. The address bar shows the URL `localhost:8888/notebooks/2nd%20final%20project.ipynb`. The notebook title is "2nd final project" with a subtitle "Last Checkpoint: 23 hours ago". The interface includes a menu bar (File, Edit, View, Run, Kernel, Settings, Help) and a toolbar with icons for saving, opening, and running code. The code editor contains the following Python code:

```
# execute button
execute_button = tk.Button(frame, text="Ask", command=execute_command, font=("Helvetica", 12), bg="light green")
execute_button.pack(pady=(0, 10))

# Output text box
output_text = scrolledtext.ScrolledText(frame, height=35, width=120, wrap=tk.WORD, bg="white", font=("Helvetica", 12))
output_text.pack(padx=5)

# Start the Tkinter event loop
window.mainloop()
```

Below the code editor, there are four empty input/output cells, each starting with `[ ]:`. The interface also shows "JupyterLab" and "Python 3 (ipykernel)" in the top right corner.

# Future Enhancement

- ❑ **Enhanced Conversational AI:** Continuously refine **NLP models** to improve understanding of diverse customer queries and provide more accurate responses.
- ❑ **Augmented Reality (AR) Integration:** Implement **AR features** to allow customers to **visualize cars** in their own environment using their mobile devices.
- ❑ **Virtual Reality (VR) Showrooms:** Create **immersive VR experiences** where customers can explore **detailed 3D models** of cars and interact with features.
- ❑ **Advanced Personalization:** Leverage AI to offer even more **personalized recommendations** based on user behavior, preferences, and past interactions.
- ❑ **Voice Assistant Compatibility:** Integrate with popular voice assistants like **Amazon Alexa and Google Assistant** for seamless **voice-activated interactions**.
- ❑ **Real-Time Customer Support:** Implement real-time chat support with human agents to assist with complex queries and provide a hybrid **AI-human customer service** experience.
- ❑ **Expanded Simulation Scenarios:** Add more detailed and varied **AI-generated simulations**, including different driving conditions and environments.
- ❑ **Predictive Maintenance Insights:** Offer insights on vehicle maintenance and performance predictions using **AI-driven analytics**.
- ❑ **Multilingual Support:** **Multilingual support** to cater to a global audience, making the platform accessible to non-English speakers.
- ❑ **Feedback Loop Integration:** Develop a **robust feedback mechanism** to continuously gather user input and make iterative improvements based on real-time data and user suggestions.

# Project Plan

## ❑ Requirements Gathering

- ❑ Define project scope and objectives
- ❑ Identify key features and functionalities
- ❑ Gather user requirements and expectations

## ❑ Design and Planning

- ❑ Create wireframes and **HTML/CSS (Tailwind)** designs.
- ❑ Design system architecture and data flow
- ❑ Plan project timeline and milestones

## ❑ Development

- ❑ Frontend Development:
  - ❑ Implement interactive **HTML/CSS** with **React.js**
  - ❑ Integrate responsive design for cross-device compatibility
- ❑ Backend Development:
  - ❑ Set up **Node.js/Express** server
  - ❑ Develop **RESTful APIs** for data handling and AI integration
- ❑ AI Integration:
  - ❑ Implement **NLP models** using **Hugging Face Transformers**
  - ❑ Develop personalized recommendation algorithms
  - ❑ **GraphQL**: An alternative to **REST** for more efficient data fetching

## ❑ Testing

- ❑ Conduct unit testing for frontend and backend components
- ❑ Perform integration testing of AI models and APIs

# Project Plan

## ❑ Deployment

- ❑ Deploy the prototype on a scalable cloud platform like **AWS**
- ❑ Set up continuous integration and deployment (CI/CD) **Git and GitHub**.

## ❑ Evaluation and Iteration

- ❑ Collect user interaction data and feedback
- ❑ Analyze performance metrics and identify improvement areas
- ❑ Iterate on the design and functionalities based on insights
- ❑ Deliverables:
  - ❑ Functional interactive website prototype
  - ❑ Frontend: **React.js** for UI, communicating with the backend via **REST or GraphQL**.
- ❑ Backend:
  - ❑ **Node.js/Express.js** for handling requests, processing data, and serving the AI models.
- ❑ AI:
  - ❑ **Python** with **Pyaudio** for building the AI models, using **NLP** libraries for understanding customer queries
  - ❑ AI-powered **virtual assistant with NLP** capabilities
  - ❑ Personalized recommendations and AI-generated simulations
  - ❑ User feedback and performance analysis report

# Thank you
